Q1. *State Moore's Law?*

Answer :- Moore's Law is the observation made in 1965 by Gordon Moore, co-founder of Intel, that the number of transistors per square inch on integrated circuits had doubled every year since the integrated circuit was invented.

Moore predicted that this trend would continue for the foreseeable future. In subsequent years, the pace slowed down a bit, but data density has doubled approximately every 18 months, and this is the current definition of Moore's Law, which Moore himself has blessed. Most experts, including Moore himself, expect Moore's Law to hold true until 2020-2025.

Q2. *Specify the various generations of computer technology?*

Answer :- There are five generations of computer technology and they are -

First Generation Of Computers (1942-1955)

The first generation computers were used during 1942-1955. They were based on **vacuum tubes**. Examples of first generation computers are ENIVAC and UNIVAC-1.

Advantages :-

1. Vacuum tubes were the only electronic component available during those days.
2. These computers could calculate data in millisecond.

Disadvantages :-

1. The computers were very large in size.
2. They consumed a large amount of energy.

Second Generation Computers (1955-1964)

The second generation computers used transistors

Advantages :-

- 1.Smaller in size as compared to the first generation computers.
- 2.Used less energy and were not heated.

Disadvantages :-

- 1.Cooling system was required.
- 2.Only used for specific purposes.

Third Generation Computers (1964-1975)

The Third generation computers used the integrated circuits (IC).

Advantages :-

- 1.Smaller in size as compared to previous generations.
- 2.Produced less heat as compared to the previous two generations of computers.

Disadvantages :-

- 1.Air conditioning was required.
- 2.Highly sophisticated technology required for the manufacturing of IC chips.

Fourth Generation Computers (1975-Present)

The fourth generation computers started with the invention of the Microprocessor. The Microprocessor contains thousands of ICs.

Advantages :-

- 1.More powerful and reliable than previous generations.
- 2.Small in size.

Disadvantages :-

The latest technology is required for manufacturing of Microprocessors.

Fifth Generation Computers (Present & Beyond)

Scientists are working hard on the 5th generation computers with quite a few breakthroughs. It is based on the technique of Artificial Intelligence (AI).Computers can understand spoken words & imitate human reasoning. Can respond to its surroundings using different types of sensors. Scientists are constantly working to increase the processing power of computers. They are trying to create a computer with real IQ with the help of advanced programming and technologies. IBM Watson computer is one example that outsmarts Harvard University Students. The advancement in modern technologies will revolutionize the computer in future.

Q4. Determine $X + Y$, $X - Y$, $X * Y$, and X/Y in each of the following sets of binary numbers:

(a) $X=1101010$ (b) $X=101101$ (c) $X=1001$

$Y=10111$ $Y=1111$ $Y=1111$

Handwritten calculations for binary operations:

(a) $X=1101010$, $Y=10111$

$X + Y$:

$$\begin{array}{r} 1101010 \\ + 10111 \\ \hline 10000001 \end{array}$$

$X - Y$:

$$\begin{array}{r} 1101010 \\ - 10111 \\ \hline 1010011 \end{array}$$

$X * Y$:

$$\begin{array}{r} 1101010 \\ \times 10111 \\ \hline 1101010 \\ 1101010 \\ 1101010 \\ 0000000 \\ 1101010 \\ \hline 10011000110 \end{array}$$

X/Y :

$$\begin{array}{r} 1101010 \\ \div 10111 \\ \hline 10011000110 \end{array}$$

Conversions:

$1101010 = 106$
 $10111 = 23$

Decimal calculations:

$106 \div 23 = 4.6$

$106 - 92 = 140$
 $140 - 138 = 2$

$100.11 = X/Y$

$.6 \times 2 = X.2$

$1001 = 1111 \div 101101$

$1001 = 1111 + 000110$

$1001 = 1111 \times 1001$

$1001 = 1111 \times 1001$

(b)

$$\begin{array}{r} 101101 \\ + 1111 \\ \hline 0111100 \end{array}$$

$$\begin{array}{r} 101101 \\ - 1111 \\ \hline 11110 \end{array}$$

$$101101 = 45$$

$$45 \times 15 = 675$$

$$1111 = 15$$

$$101101 \times 1111 = 1010100011$$

$$\begin{array}{r} 3 \\ 15 \overline{) 45} \\ \underline{45} \\ 0 \end{array}$$

$$\begin{array}{r} 2 \overline{) 3} -1 \\ \underline{1} \end{array}$$

$$101101 \div 1111 = 11$$

$$\begin{array}{r} 2 \overline{) 675} -1 \\ \underline{2} \end{array}$$

$$\begin{array}{r} 2 \overline{) 84} -0 \\ \underline{2} \end{array}$$

$$\begin{array}{r} 2 \overline{) 42} -0 \\ \underline{2} \end{array}$$

$$\begin{array}{r} 2 \overline{) 21} -1 \\ \underline{2} \end{array}$$

$$\begin{array}{r} 2 \overline{) 10} -0 \\ \underline{2} \end{array}$$

$$\begin{array}{r} 2 \overline{) 5} -1 \\ \underline{2} \end{array}$$

$$\begin{array}{r} 2 \overline{) 2} -0 \\ \underline{2} \end{array}$$

(c)

$$\begin{array}{r} 1001 \\ + 1111 \\ \hline 11000 \end{array}$$

$$\begin{array}{r} 1001 \\ - 1111 \\ \hline 110 \end{array}$$

$$1001 = 9$$

$$15 \times 9 = 135$$

$$1111 = 15$$

$$1001 \times 1111 = 10000111$$

$$0.100$$

$$\begin{array}{r} 0.6 \\ 15 \overline{) 90} \\ \underline{90} \\ 0 \end{array}$$

$$0.6 \times 2 = 1.2$$

$$0.2 \times 2 = 0.4 \times 2$$

Q6.Determine the output expression for the following circuit and simplify it using algebraic Manipulations.

Answer:-

$$\begin{aligned}
 Q &= (AB + C)(A + C) + B \\
 &= AB + AC + ABC + C + B \\
 &= B(AC + 1) + AB + C(A + 1) \\
 &= B + AB + C \\
 &= B(A + 1) + C \\
 &= B + C
 \end{aligned}$$

I.e. $Q = B + C$
